PCR was performed on DNA from transformants of Arabidopsis thaliana
plants from INRA (Versailles). The DNA fragment (s) resulting from
the PCR were directly sequenced from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
been generated in the framework of the French plant genomics
program 'Genoplante' (http://www.genoplante.com and
http://genoplante-info.infobiogen.fr).

Baker JB, Cronin MT, Shak S, Baselga J; Prognosing a patient with EGFR-expressing colon cancer comprises subjecting a sample comprising EGFR-expressing cancer cells to quantitative analysis of the expression level of the RNA transcript of least one gene e.g., CD44v3. This invention relates to a novel method concerning prognostic markers associated with EGFR (epidermal growth factor receptor) positive cancer. Specifically, it refers to a gene expression profiling method that can provide a prediction as to agene expression profiling method that can provide a prediction as to whether a patient is likely to respond well to treatment with an EGFR inhibitor. The present invention describes the quantitative analysis of the expression level of the RNA transcript of the est product the group of CD44v3, CD44v6, RR5, GROI, KRT17, LAMC2 or their products thereof. It further provides a CDNA which are useful for determining whether a patient diagnosed with an EGFR expressing head or neck cancer or colon cancer exhibits elevated or beckpressing head or neck cancer or colon cancer exhibits elevated or

detecting a first subunit protein (1) of telomerase. R1 and R2 both bind to (1) and have formulae 5'-A-B-C-3' (R1) 5'-D-E-F-3' (R2) where: A and F c R not and a segment of 10 to 100000 nucleotides (nt) that together are replicated by RNA replicase; B and E = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of RNA segments of 1 to 10000 nt which can be ligated together. Ligation of to (1). Replication of R3 by RNA replicase indicates presence of (1). Also described are: (1) method for detecting (I) using R1 and R2; (2) kit for this process containing R1, R2, by transcription from appropriate DNA. R1 and R2 are used to detect and quantify telomerase, particularly cordiagnosis of cancer and for detection of metastases. R1 and R2 present assay that does not require expensive equipment or highly trained personnel, and is suitable for automation. The present sequence represent an oligonucleotide used in the exemplification of the present
                                                                                                                                                                                                ö
these methods are also useful for prognosing or predicting the likelihood of cancer-attributable death or progression, including recurrence and metastatic spread of a neoplastic disease, as well as drug resistance. This polynuclectide sequence is a human PCR amplicon DNA sequence used as a prognostic cancer marker, given in an exemplification of the invention.
                                                                                                                                                                                                                                  371 AAGAGGAACGGAGCGAGTCCCCGCGCGCGCGCGATTCCCTGAGCTGTGGGACGTGCACC 430

components. RNA1 has the formula 5'-A-B-C-3', where A is section having components. RNA1 has the formula 5'-A-B-C-3', where A is section having components. RNA1 has the formula 5'-A-B-C-3', where A is section having components. RNA1 has the formula 5'-A-B-C-3', where A is section having components. RNA1 has the formula 5'-A-B-C-3', where A is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the RBP and which can bind to the protein component; C is section having a about 1-20 nucleotides which have affinity to second consensus sequence of the RBP conclectides which have affinity to second consensus sequence of the RBP conclectides which have affinity to second consensus sequence of the RBP conclectides which have affinity to second consensus sequence of the RBP conclectides which have affinity to second consensus sequence of the RBP conclectides which have affinity to second consensus as sequence of the RBP conclectides which can be received by an RNA replicase and with A being replicated. RNA1 and RNA2 are capable of forming a third RNA (RNA3) coff formula 5'-B-E-F-3'. The method is useful for the identification and characterization of RNA sequences having specific affinity to amino acid consensus sequences of RBPs, and to RNAs. AAH24815-16 were used to be a consensus acused to RBPs, and to RNAs. AAH24815-16 were used to be a consensus sequence a double-stranded RNA1, comprising the Y-1 domain of human

The specification describes a first RNA (RNA1) and a second RNA (RNA2) for use in binding an RNA-binding protein (RBP) having protein and RNA components. RNA1 has the formula 5'.A-B-C-3', where A is section having (10-100,000 nucleotides and is can be received by an RNA replicase and with another DNA sequence, F, being replicated; B is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the RBP and which can bind to the protein component; C is section having about 1-20 nucleotides and which can be ligated to D of the second RNA molecule. RNA2 has the formula 5'.D-E-F-3', where D is section having 1-C and uncleotides and which can be ligated to C; E is section having 1-C and which can bind to the protein component; F is section having 10-100,000 nucleotides which have affinity to second consensus sequence of the RBP and which can bind to the protein component; F is section having 10-100,000 nucleotides which can be received by an RNA replicase and with A lobeing replicated. RNA1 and RNA2 are capable of forming a third RNA (RNA3) of formula 5'A-B-C-D-E-F-3'. The method is useful for the identification of A characterization of RNA sequences having specific affinity to anino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a pair of RNA molecules (R1, R2) for detecting a first subunit protein (1) of telomerase. R1 and R2 both bind to (1) and have formulae 5'-A-B-C-3' (R1) 5'-D-E-F-3' (R2) where: A and F - RNA segment of 10 to 100000 nucleotides (nt) that together are replicated by RNA replicase; B and E = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound to (1). Replication of R3 by RNA replicase indicates presence of (1). Also described are: (1) method for detecting (1) using R1 and R2; (2) kit for this process containing R1, R2, ligase and an amplification system; and (3) method for making R1 and R2 by transcription from appropriate DNA. R1 and R2 are used to detect and quantify telomerase, particularly for diagnosis of cancer and for detection of metastases. R1 and R2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  provide an assay that does not require expensive equipment or highly trained personnel, and is suitable for automation. The present sequence represents an oligonucleotide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pair of RNA molecules for detecting telomerase, useful for diagnosis of cancer or metastases, can be ligated when bound to telomerase subunit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                 The invention relates to promoter regions from mouse and human telomerase

RNA (TR) component genes. The TR gene promoter can be linked to a

heterologous gene, especially a gene encoding a cytotoxin, for therapy of

cancer, especially neoplasias. The telomerase is necessary for the

currestricted proliferative capacity of many human cancers. Mutation or

curregulation of the telomerase repression pathway may cause reactivation

or upregulation of telomerase expression in cancer. Substances,

clene promoter through interaction of the 5' regulatory sequences. These

substances, e.g. antisense oligonucleotides, transcription factors,

cuseful for cancer therapy. In particular, gene therapy vectors

cuseful for cancer therapy. In particular, gene therapy vectors

(sepecially pGT62-codAupp) comprising the promoter and a viral thymidine

kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that

ceplasia can be controlled or treated. Direct down-regulation of

telomerase RNA gene through manipulation of transcription factors may be

effective anticancer therapy and the cloning of the hTR gene promoter

allows the analysis of therapeutic molecules which modulate hTR promoter

cativity. Sequences AAZ07324-332 and AAZ0032-340 represent constructs

with hTR promoter sequence element mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                        and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to promoter regions from mouse and human telomerase
RNA (TR) component genes. The TR gene promoter can be linked to a
Cheterologous gene, especially a gene encoding a cytotoxin, for therapy of
Cancer, especially neoplasias. The telomerase is necessary for the
Unrestricted proliferative capacity of many human cancers. Mutation or
dysregulation of the telomerase expression pathway may cause reactivation

                                                                                                                                                                                   RMA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or dysregulation of the telomerase expression pathway may cause reactivation or dentified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07324-332 and AAZ00332-340 represent constructs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                          The invention relates to promoter regions from mouse and human telomerase
                                                                                                             Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Telomerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; hTR; gene therapy; thymidine kinase gene; anticancer therapy; human; ss.

The intention features to promoter regions from a consistences.

And (TR) component genes. The TR gene encoding a cytotoxin, for therapy of cancer, especially appeared encoding a cytotoxin, for therapy of cancer, especially appeared is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression pathway may cause reactivation or dependences expression in cancer. Substances, cor uppequiation of telomerase expression in cancer. Substances, conception in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transculction, are useful for cancer therapy. In particular, gene therapy vectors (specially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a product of eggenially pGT62-codAupp) comprising the promoter and a viral thymidine coplasia can be used to convert a product, e.g. gancyclovir, so that neoplasia can be used to convert a product, e.g. gancyclovir, convert a product down regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter allows the analysis of therapeutic molecules which modulate hTR promoter active the proportion of the think the analysis of therapeutic molecules which modulate hTR promoter allows the analysis of therapeutic molecules which modulate hTR promoter active the promoter and the converted promoter allows the analysis of therapeutic molecules which modulate hTR promoter allows the analysis of therapeutic molecules which modulate hTR promoter allows the analysis of therapeutic molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                    human telomerase
                                                                                         Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse and human telomerase RNA gene promoters, useful for tumor specific

                                                                                                                                                                                                                                                                                                                                                               셤
                     The invention relates to promoter regions from mouse and human telomerase
RNA (TR) component genes. The TR gene promoter can be linked to a
Reterologous gene, especially a gene encoding a cytotoxin, for therapy of
cancer, especially neoplasias. The telomerase is necessary for the
currestricted proliferative capacity of many human cancers. Mutation or
dysregulation of the telomerase repression pathway may cause reactivation
of upregulation of telomerase expression in cancer. Substances,
clentified in the methods, can be used to block transcription from the TR
gene promoter through interaction of the 5' regulatory sequences. These
substances, e.g. antisense oligonucleotides, transcription factors,
peptide nucleic acids and factors that disrupt signal transduction, are
useful for cancer therapy. In particular, gene therapy vectors
cuseful for cancer therapy. In particular, gene therapy vectors
cuseful for cancer therapy. In particular, gene therapy vectors
changes gene can be used to convert a products and a viral thymidine
kinase gene can be used to convert a producy, e.g. gancyclovir, so that
neoplasia can be controlled or treated. Direct down-regulation of
telomerase RNA gene through manipulation of transcription factors may be
effective anticancer therapy and the cloning of the hTR gene promoter
allows the analysis of therapeutic molecules which modulate hTR promoter
activity. Sequences AAZ07324-332 and AAZ00332-340 represent constructs
                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mouse and human telomerase RNA gene promoters, useful for tumor specific

                                                                                                                                                     identified in the methods can be used to block transcription from the gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors. peptide nucleic acids and fearors that disrupt signal transduction, useful for cancer therapy. In particular, gene therapy vectors (especially pGFG2-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be used to convert a prodrug, e.g. gancyclovir, so that conparase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the NTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZO7696-321 represent PCR primers used in cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR
cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse and human telomerase RNA gene promoters, useful for tumor specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to promoter regions from mouse and human telomerase heterologous gene, especially a gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These betide mucleic antisense oligomucleotides, transcription factors, peptide mucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine
                substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down regulation of telomerase RNA gene through manipulation of transcription factors may be
                                                                                                                                                       effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07696-321 represent PCR primers used in cloning and mutagenisis of human TR gene (HTR) promoter region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mouse and human telomerase RNA gene promoters, useful for tumor specific

The oligonucleotide can be used as an affinity agent in the methods of the chromation, which are used to purify human telomerase. The methods involve the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing positive charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for
kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AA207669-321 represent PCR primers used in cloning and mutagenisis of human TR gene (hTR) promoter region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a telomerase target sequence. The invention relates to an antisense oligomucleotide used as a control sequence alongside a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide cativity. Telomerase tis a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide cativity include the sequence GTIAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The thorapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases. The immunodeficiency virus (HIV) infection/AIDS (exquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other diseases characterized by abnormal telomere metabolism or telomerase cutving agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization
                                                                                                                          ö
biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.
                                                                                                                                                                                                                                                                                                                                                            Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of
probes to detect or quantitate polynucleotides having a human telomerase RNA (hTR) sequence. PNA probes are also used for forensic identification of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or

mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity teating or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNAs an be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antimoplastic or rytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HTV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence repersenting hTR RNA strand #2 is used to test the inhibition of telomerase activity by the PNAs of the present
                                                                                                                                                                                                                                                                                          ó;

purity compared with a crude extract of cells from adenovirus-transformed kidney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful for inducing a chamoral or cell-mediated immune response in an animal. Purified telomerase associated with over-expression of telomerase, such as cancer and for producing antibodies that recognize telomerase, which are useful as a ffinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as call or tissue. Identification confuencase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of screening compounds to identify agents that alter the association of telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase.
                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a purified human telomerase protein, which when associated with telomerase RNA component has DNA polymerase activity. Also disclosed in the specification is a method for assessing a regulator (preferably a telomerase inhibitor or activator of telomerase involves

measuring telomerase enzymatic activity of the composition in presence of a regulator. The telomerase protein of the invention may be used in developing and testing assays for measuring telomerase activity which are useful in characterising cancer and pre-cancer cells, for identifying and testing regulators of telomerase activity in in vitro assay and for preparing antibodies against telomerase. The mammalian telomerase protein of the invention is at least approximately 3000 fold more pure (in terms of telomerase activity per weight of protein) than a crude extract of cell from adenovirus- transformed kidney cell. Purified telomerase cativity bacomerase with the nayme's mechanism for developing mechanism- based regulators. The present sequence represents a human telomerase antisense oligonucleotide which has affinity to telomerase and is used to purify the telomerase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of obtaining mammalian telomerase protein (I). The method involves preparing enriched solution (ES) from a cell expressing telomerase where the component of (I) in ES is separated from other proteins expressed by cell by combining ES with oligonucleotide (O) having specific affinity for (I), and collecting protein bound to (O). The oligonucleotide comprises a retrievable label such as biotin and contains a sequence that is specifically recognized by telomerase protein. The oligonucleotide contains or does not contain the sequence (TTAGGG)3. The method further comprises combining a fraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Obtaining telomerase, by preparing enriched solution from cell expressing telomerase, combining the solution with oligonucleotide having specific affinity for the protein and collecting protein bound to oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Weinrich SL, Atkinson EM, Lichtsteiner SP, Vasserot AP, Pruzan RA;

containing telomerase protein with an anion exchange matrix, and collecting protein that binds the matrix, combining a fraction containing telomerase protein with a cation exchange matrix (such as a heparin matrix), and collecting protein that binds the matrix. The method comprises successively enriching fractions containing telomerase protein on several different ion exchange matrices and combining a fraction containing telomerase protein with an intermediate selectivity matrix, collecting protein that binds the matrix, where the intermediate selectivity matrix and separating a fraction containing the telomerase protein by gel filtration chromatography or gradient centrifugation. The telomerase is enriched from an extract of cells stably expressing telomerase. This sequence represents an antisense oligonucleotide to the RNA component of human telomerase that can be used in the purification
                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                   à
                            The invention relates to a method for identifying regulators of telomerase activity that may be useful for treating cancers. The method may be used to identify regulators e.g. antibodies, of telomerase activity which may be useful as cancer treatments. It has been found that found that the cells of many human cancers have telomerase activity. This helps explain why cancer cells continue dividing without becoming senescent. If telomerase activity in cancer cells can be inhibited, the cancer cells are expected to reach senescence and cease dividing. The present sequence is human telomerase antisense oligonulceotide used to
                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mouse, rat and chinese hamster are all claimed. Antisense digonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomera regulation in vivo, and the role it plays in immortalisation. Three primers (AATI1040, AATI1043,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        - useful in studying

AAT11044) were used to produce antisense oligonucleotides which were then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a PCR primer for a RNA component of human library obtd. From the human ling fibroblast cell line Win-38. The RCHT can be used in the recombinant prodn. of an active telomerase mol. synthesis of mutant sequences to chromosomal DNA telomeres, and in the capable of adding sequences for the detection of mutant mammalian telomerase RNA component polynucleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase modulating agents, and in the detection the identification of telomerase modulating agents, and in the detection Polynucleotides of at least 25 consecutive nucleotides identical, or complementary to the RFHT sequence linked to heterologous transcriptional regulatory sequences, can be used for the gene therapy of human diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human - useful in identifying
                 used to produce antisense expression plasmids. AAT11040 was used alongside both AAT11043 and AAT11044 to produce two different antisense
                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RNA component; human; telomerase; lung fibroblast; cell line WI-38;
                                                                                                                                                                                                                                                                                                                                                                                                                                        RNA component of human telomerase antisense plasmid PCR primer G1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods of the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing negative charges, an matrix that binds molecules bearing negative charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in
                                                                                                                                                                                                                                                                                                                                                                               Human; telomerase RNA component; anticancer therapy; purification; assay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Atkinson EM, Lichtsteiner SP, Vasserot AP, Pruzan RA;
